## Change History

## 1 Research purpose

Through the review of clinical data collected from hospitals in different countries and negative clinical results made within the company, the data were summarized and analyzed, so as to verify the clinical performance of the COVID-19 Test Kit (Colloidal Gold Method). It is to verify that the accuracy of the product in clinical trial, by using PCR as control reagent, meets the requirement of 90% to determine that whether the product can meet the expected safety and effectiveness.

## 2 Reagent information

Product name: COVID-19 Test Kit (Colloidal Gold Method)

Manufacturer: Hangzhou Singclean Medical Products Co., Ltd.

Control reagent: PCR

## 3 Product introduction

People are generally susceptible. Currently, the patients infected by the novel coronavirus are the main source of infection; asymptomatically infected people can also be an infectious source. Based on the current epidemiological investigation, the incubation period is 1 to 14 days, mostly 3 to 7 days. The main manifestations include fever, fatigue and dry cough. Nasal congestion, runny nose, sore throat, myalgia and diarrhea are found in a few cases.

## 4 Intended use

COVID-19 Test Kit (Colloidal Gold Method) is a solid phase immunochromatographic assay for the rapid, qualitative detection of antigen to 2019 Novel Coronavirus in human nasal cavity. This test provides only a preliminary test result. Therefore, any reactive specimen with the COVID-19 Test Kit (Colloidal Gold Method) must be confirmed with alternative testing method(s) and clinical findings.

## 5 Principle of products

The COVID-19 Test Kit (Colloidal Gold Method) is a colloidal gold immunochromatographic assay. The test uses COVID-19 (SARS-CoV-2) antibody (test line T) and goat anti-mouse IgG (control line C) immobilised on a nitrocellulose strip. The burgundy colored conjugate pad contains colloidal gold conjugated to another COVID-19 (SARS-CoV-2) antibody conjugated with colloid gold and mouse IgG-gold conjugates. When the processed buffer containing the sample is added to the sample well, COVID-19 (SARS-CoV-2) will combine with the COVID-19 antibody conjugate to form an antigen-antibody complex. This complex migrates through nitrocellulose membrane by capillary action. When the complex meets the line of the COVID-19 antibody of

test line T, the complex is trapped forming a burgundy colored band which confirm a reactive test result. Absence of a colored band in the test region indicates a non-reactive test result. The test contains an internal control (C band) which should exhibit a burgundy colored band of the immunocomplex goat anti-mouse IgG/mouse IgG-gold conjugate regardless of the color development on any of the test bands. Otherwise, the test result is invalid and the specimen must be retested with another device.

## 6 Clinical Trial Center

- 6.1 TEODORO MALDONADO CARBO, Hospital in Ecuador
- 6.2 IEES LOS Ceibos del Norte de Guayaquil, Hospital in Ecuador
- 6.3 Hospital Arnau, Hospital in Spain
- 6.4 Laboratory of Hangzhou Singclean Medical Products Co., Ltd.

## 7 Specimen type

Specimen taken from the human nasopharynx by a nasopharyngeal or nasal swab, from oropharynx by a oropharyngeal or throat swab. Use freshly collected samples for optimal test performance. Inadequate sample collection or improper sample handling may yield a false-negative result.

Nasal swab, oropharyngeal swab and nasopharyngeal swab can be used by Singclean Products Covid-19 Test kit (Colloidal Gold Method) one step Coronavirus Antigen Rapid Test Cassette (Nasopharyngeal Swab/Nasal Swab/Oropharyngeal swab) to detect the presence of SARS-CoV-2 antigen in the specimen.

Internal validation studies based on Matrix Equivalency were performed on nasal swab, oropharyngeal swab and nasopharyngeal swab specimens, no statistic difference was observed among those specimens.

## 8 Specimen requirements

Each specimen shall contain the following information:

- The specimen collection date;
- Date of onset of symptoms (if present);
- Date of PCR testing;
- Severity or absence of symptoms;
- Tests used to identify COVID-19 patients.

## 9 Experiment method

Allow test cassette, specimen, and Antigen extract buffer control to equilibrate to room temperature(15-30°C) prior to testing.

- a) Remove the test cassette from the sealed foil pouch and use it as soon as possible. Best results will be obtained if the assay is performed within one hour.
- b) Place the test device on a clean and level surface.
- c)
  1. Ask the patient to remove the secretions on the surface of the anterior nasal cavity, keep the head slightly tilted, and gently and slowly insert the swab through the nasal cavity to the nasopharynx, When resistance is encountered, it will reach the posterior nasopharynx, turn the swab 10 times and then remove it from the nostril.
  2. The sterile swab (stick) should be inserted into 2.5cm (1 inch) from the edge of the nostril. Hit the swab 5 times along the mucous membrane inside the nostrils to ensure that both mucus and cells are collected. Repeat this procedure for the second nasal stick to ensure that a sample is taken from both nasal cavities.
  3. Insert a sterile swab (stick) into the neck, which is essential secretion from the red area of the throat and maxillary to take a sample from the neck. Moderately you will test the bilateral cervical tonsils and the stench of the throat to get a sample.
- d) Place the antigen extraction tube on the workbench. Place the antigen extraction buffer bottle vertically downward, squeeze the bottle to make the buffer drip freely into the extraction tube without touching the edge of the tube, and add 6 drops (about 200ul) to the extraction tube.
- e) Put the swab specimen into the extraction tube pre-added with the antigen extraction buffer, and rotate the swab about 10 times while pressing the swab head against the tube wall to release the antigen in the swab, then let it stand for about 1 minute.
- f) Remove the swab while squeezing the tip of the swab so that as much liquid in the swab can be discharged as possible. Dispose of used swabs in accordance with biohazard waste disposal methods.
- g) Install the dripper on the extraction tube and cap it tightly, and let it stand for about 1 minute.
- h) Open the aluminum foil bag and take out the test card, add 3 drops (about 100ul) into the sample hole of the test card (or use a pipette to add 100ul), and start the timer.
- i) Wait for the colored line to appear. The result should be read in 15 minutes. Do not interpret the result after 20 minutes.

Note: The detection steps need to be completed under protection against infection.

## 10 Test data

### 10.1 TEODORO MALDONADO CARBO, Hospital in Ecuador

Testing Date	2020.11.09~2020.11.19

#### 11 Different Method Ways Summary and Analysis

Nasal Swab Method		PCR results		Total
		Positive	Negative	
COVID-19 Test kit	Positive	79	1	80
	Negative	1	80	81
Total		80	81	161

Sensitivity: 79/(79+1) 98.75 %

Specificity: 80/(1+80) 98.77 %

Accuracy: (79+80)/161 98.76 %

Oropharyngeal Method		PCR results		Total
		Positive	Negative	
COVID-19 Test kit	Positive	96	1	97
	Negative	1	74	75
Total		97	75	172

Sensitivity: 96/(96+1) 98.97 %

Specificity: 74/(1+74) 98.67 %

Accuracy: (96+74)/172 98.84 %

Nasopharyngeal Method		PCR results		Total
		Positive	Negative	
COVID-19 Test kit	Positive	31	1	32
	Negative	1	152	153
Total		32	153	185

Sensitivity: 31/(31+1) 96.88 %

Specificity: 152/(1+152) 99.35 %

Accuracy: (31+152)/185 98.92 %

## 12 Data summary and analysis

Method		PCR results		Total
		Positive	Negative	
COVID-19 Test kit	Positive	206	3	209
	Negative	3	306	309
Total		209	309	518
Sensitivity		98.56%	95% confidence interval	95.87%~99.51%
Specificity		99.03%	95% confidence interval	97.18%~99.67%
Accuracy		98.84%	95% confidence interval	97.50%~99.47%

### 12.1 Sensitivity calculation

$$\text{Sensitivity} = 206 / (206+3) = 98.56\%$$

### 12.2 Specificity calculation

$$\text{Specificity} = 306 / (3+306) = 99.03\%$$

### 12.3 Accuracy calculation

$$\text{Accuracy} = (206+306) / 518 = 98.84\%$$

### 12.4 Sensitivity confidence interval calculation

$$Q1 = 2a + 1.96^2 = 2 * 1.96^2 = 415.842$$

$$Q2 = 1.96 \sqrt{1.96^2 + 4ac / (a + c)} = 1.96 \sqrt{1.96^2 + 4 * 206 * 3 / (206 + 3)} = 7.759$$

$$Q3 = 2(a+c+1.96^2) = 2(206+3+1.96^2) = 425.683$$

$$\text{Sensitivity confidence interval up limit} = 100\% (Q1 - Q2) / Q3 = 100\% * (415.842 - 7.759)$$

$$/ 425.683 = 95.87\%$$

**Sensitivity** confidence interval lower limit = $100\%(Q_1 + Q_2)/Q_3=100\%*(415.842+7.759)$

/425.683=99.51%

### 12.5 Specificity confidence interval calculation

$$Q_1=2d+1.96^2=2*306+1.96^2=615.842$$

$$Q_2=1.96\sqrt{1.96^2 + 4bd/(b+d)}=1.96\sqrt{1.96^2 + 4 * 306 * 3/(306 + 3)}=7.772$$

$$Q_3=2(b+d+1.96^2)=2*(306+3+1.96^2)=625.683$$

Specificity confidence interval up limit = $100\%(Q_1 - Q_2)/Q_3=100\%*(615.842-7.772)$

/625.683=97.18%

Specificity confidence interval lower limit = $100\%(Q_1 + Q_2)/Q_3=100\%*(615.842+7.772)$

/625.683=99.67%

### 12.6 Accuracy confidence interval calculation

$$Q_1=2(a+d)+1.96^2=2(206+306)+1.96^2=1027.842$$

$$Q_2=1.96\sqrt{1.96^2 + 4(a+d)(b+c)/n}=1.96\sqrt{1.96^2 + 4(206+306)(3+3)/518}=10.29$$

$$Q_3=2(n+1.96^2)=2(518+1.96^2)=1043.683$$

Accuracy confidence interval up limit = $100\%(Q_1 - Q_2)/Q_3=100\%*(1027.842-10.29)/1043.683=$

97.50%

Accuracy confidence interval lower limit = $100\%(Q_1 + Q_2)/Q_3=100\%*(1027.842+10.29)$

/1043.683= 99.47%

### 12.7 Kappa

$$PA=\frac{a+d}{n}=\frac{206+306}{518}=0.9884$$

$$Pe=\frac{(a+b)(a+c)+(c+d)(b+d)}{n^2}=\frac{(206+3)(306+3)+(3+306)(3+306)}{518^2}=0.5931$$

$$Kappa=\frac{PA-Pe}{1-Pe}=\frac{0.9884-0.5931}{1-0.5931}=0.9715$$

Kappa (k): k>0.75, means good consistency; 0.40<k<0.75, not very consistent; K <0.40, poor consistency.

## 13 Conclusion

The expected research purpose has been achieved. The total number of samples studied is 518, of which 209 are positive and 309 are negative. Compared with PCR, the sensitivity of the product is 98.56% (confidence interval is 95.87%~99.51%), specificity is 99.03% (confidence interval is 97.18%~99.67%), and accuracy is 98.84% (confidence interval is 97.50%~99.47%). The Kappa is 0.9715, reach "K>0.75", which proves that the results of this study are in good consistency.
